No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Description

            The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. PCR primers AAH25425-26 were used to amplify the flanking region of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic plant is useful for producing a hybrid seed by crossing the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed trom the transgenic Brassica plant.

The present sequence is primary thermal interlaced (TAIL)-PCR primer MDB251 used to right (5') and left (3') border flanking region of elite event MS-B2. This primer corresponds to position 293-317 of plasmid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PCR primer MDB251 to generate the flanking region of elite event MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -

                                                                                                                                                                                                                                                                                                                                                                                                                 The Legumin gene B4 is used. The unique BglII-Ort (815-820) site is for ligating foreign DNA and the HindIII-Ort in the 3' polylinker (1080-1085) for cloning the cassette in the Ti-vector pGA471. The cassette is cloned into the binary Ti-vectors pGA471 and Agrobacterium tumefaciens is transfected.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The HindIII-ECORI fragment (AAT39337) of plasmid pTS88 contains barstar DNA under control of a 35S promoter. The plasmid was used with prg134 (see also AAT39336) contg. barnase DNA under control of the stamen-specific promoter El to produce male sterile rice cv. Kochihibiki transgenic plants, and with plasmid pVE136 (see also AAT39338) contg. barnase DNA under control of the stamenspecific PCA55 promoter to produce male sterile malze plants. Expression of barnase (a ribonuclease) in the stamen leads to male sterility. Constitutive expression of barstar counteracts possible low level expression of barnase DNA in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                               Prodn. of male sterile plants by transforming with a chimaeric construct - comprising a male sterility DNA e.g. barnase and a co-regulating gene, e.g. barstar, into the nuclear genome, useful for generating hybrid cultivars
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                'note = "synthetic polylinker derived sequences"

```
Transgenic winter oilseed rape plants suited for producing hybrid seed with improved qualities, comprises a male-sterility gene and fertility restorer gene, integrated into the genome
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene, and the other plant has an expression cassette comprising a fertility restorer gene, integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid
                                                                                                                                                                                                                                                                                                                                                                     /note- "atS1A ribulose-1,5-biphosphate carboxylase small subunit gene from Arabidopsis thallana"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                *tag= p

seed have agronomic performance, genetic stability and adaptability to different genetic backgrounds. The present sequence represents plasmid prHWHIB. This plasmid comprises the barstar gene, which acts as a fertility restorer gene. The plasmid is used to create transgenic plants of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 barnase coding sequence under control of the tobacco TA29 gene stamen-specific promoter and a phosphinothricin acetyltransferase coding sequence under control of an Arabidopsis Rubisco small subunit gene promoter. Oilseed rape hypocotyl explants were infected with Agrobacterium tummefaciens C58ClRif carrying vector pyrWUOT and helper Ti plasmid pwRGO. In some treatments, the hypocotyls were treated with the poly (ADP-ribose) polymerase inhibitor niacinamide (250 mg/l) 4 days prior to infection. Blants regenerated from niacinamide-treated transformed calli had a low copy number and displayed less variation in the expression profile of the transgenes.
                                                                                                                                                                                                                                                                                             Prodn. of transgenic plants using a poly-(ADP-ribose) polymerase inhibitor - reduces the cultured cells response to stress and reduces metabolism
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /note= "synthetic polylinker derived sequences"

The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene, and the other plant has an expression cassette comprising a fertility restorer gene, integrated into the genome. The fertility restorer gene is capable of preventing the activity of the male-sterility gene. The plant pair is useful for producing hybrid seed. Plants developed from the hybrid different genetic backgrounds. The present sequence represents plasmid pfHWN107. This plasmid comprises the barnase gene, which acts as a male-sterility gene. The plasmid is used to create transgenic plants
                                                                                                                                                                                                                                                                                                                               /note- "3'UTR downstream of Bacillus amyloliquefaciens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to a method for producing male sterile plants. The method comprises inserting a promoter fragment upstream of an RNAse gene and a second promoter, upstream of an RNAse inhibitor protein gene and inserting it into the plant genome. The method is useful for producing male sterile tobacco, lettuce and rapesed plants, but preferably rice and maize. The present sequence is a vector used in the method of the present invention.

in male-sterile plant lines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence was used in the preparation of an improved Bacillus amyloliquefaciens barstar, i.e. barnase inhibitor, which can be used to restore fartility to male-sterile lines. The DNA sequence encoding the improved barstar, leads to increased barstar production in tapetum cells, due to improved translation, and possibly protein stability.

                                                                                                                                                                                                                                      Plasmid pTCOll3 (AAT39339) is a T-DNA vector containing a bar gene under control of the PSSU promoter, a barnase gene under control of the stamen-specific PTA29 promoter, and a barstar (co-regulatory) gene under control of the pnos promoter. 87% of oilseed rape plants regenerated after Agrobacterium-mediated transformation using pTCOll3 were male sterile. Barnase expression disturbed the function of stamen cells leading to male sterility. Constitutive expression of barstar counteracted any low level expression of barstar counteracted any low level expression of barnase in non-stamen tissue.

Plasmid pTCOll3 (AAT39339) is a T-DNA vector containing a bar gene under control of the PSSU promoter, a barnase gene under control of the stamen-specific PTA29 promoter, and a barstar (co-regulatory) gene under control of the Pnos promoter. 87% of oilseed rape plants regenerated after Agrobacterium-mediated transformation using pTCOll3 were male sterile. Barnase expression disturbed the function of stamen cells leading to male sterility. Constitutive expression of barstar counteracted any low level expression of
                                                                                                                                                                                                                                                                                                                  /note= "region containing polyA signal of nopaline synthase gene of Agrobacterium T-DNA" complement (3032, 3367)

                       transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic gene, at a specific location in the Brassica genome. Transgenic brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is chimneric T-DNA of plasmid prooll3. This sequence comprises right border repeat, left border repeat and 3' untranslated region (UTR) from TL-DNA of priB653, synthetic polylinker sequences, coding regions of blalaphos resistance gene (bar) from Striptomyces hyproscopicus, barnase gene from Bacillus amyloliquefaciens and promoters of atSIA arabidopsis thallana, the anther-specific gene from the T-DNA of priB37 of Agrobacterium tumefaciens.
                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T-DNA; plasmid pTCO113; transgenic Brassica plant; transformation event; male-sterility gene; chimeric; tobacco; ds.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        promoter
                                                                                                                                                                                                                                                   3'UTR
```

```
The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic Brassica plant is useful for producing a hybrid seed by crossing the transgenic plant with a male-fertile Brassica plant and harvesting the transgenic plant with a male-fertile Brassica plant.

The present sequence is chimeric T-DNA of plasmid prcoll3. This sequence comprises right border repeat, left border repeat and 3' untranslated region (UTR) from T-DNA of prises, synthetic polylinker sequences, coding regions of bialaphos resistance gene (bar) from Streptomyces hygroscopicus, barnase gene from Bacillus amyloliquefaciens and promoters of atSiA ribulose-15-biphosphate carboxylase small subunit gene from Arabidopsis thallana, the anther-specific gene from the T-DNA of prir37 of the anther-specific gene from the T-DNA of prir37
                                                                                                                                        Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 5865 BP; 1849 A; 1095 C; 1149 G; 1772 T; 0 other;

Sequence 4, Application US/08894440

Patent No. 6025546

GENERAL INFORMATION:

APPLICANT: PLANT GENETIC SYSTEMS N.V.

TILLE OF INVENTION: Method to obtain male sterile plants

FILE REFERENCE: NASCOR

CURRENT APPLICATION NUMBER: US/08/894,440

CURRENT FILING DATE: 1997-11-12

NUMBER: PATENTIN ONS: 4

SOFTWARE: PATENTIN Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      NAME/KEY: misc_feature

Patent No. 6025546
GENERAL INFORMATION:
APPLICANT: PLANT GENETIC SYSTEMS N.V.
TITLE OF INVENTION: Method to obtain male sterile plants
FILE REFERENCE: NMSCOR
CURRENT FILING DATE: 1997-11-12
NUMBER OF SEQ ID NOS: 4
SOFTAME: Patentin Ver. 2.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           NAME/KEY: misc_feature

/dev_stage="A
brain genomic DNA was isolated and partially digested with a combination of EcoRI and EcoRI Methylase. Size selected DNA was cloned into the pBACe3.6 vector at the ECORI sites. The ligation products were transformed into DH10B electrocompetent cells (BRL Life Technologies).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Fax: +55-11-2704922

RIKEN. Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. 1st strand CDNA was primed with a primer [5] of the primer [5] of the primer [5] of the prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. Second strand CDNA was prepared for full-length by primer adapter of sequence [5] of the primer adapter of sequence [6] of the primer adapter 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens

The sequence contained an oligo-dr track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Noti site and the oligo-dr track served to identify it as a clone from the Soares Lab Clone distribution: clones will be available through Soa polyA-Yes.

The sequence contained an oligo-df track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NoII site and the oligo-df track served to identify it as a clone from the normalized thalamus library cDNA Library Preparation: M.B. Soares Lab Clone distribution: clones will be available through Research
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Eukaryota; Métazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

for genomic studies. In order to facilitate positional clouhing, physical mapping and genome sequencing of rice, we have constructed a BAC library from Oryza sativa, Nipponbare variety using Ecorl as the cloning enzyme. The library contains 55,296 clones with an average insert size of 121 Kb providing approximatley 15 haploid genome equivalents. The deep coverage allows the isolation a particular sequence with a probability of 99.9 %. Three high density filters, each containing 18,432 clones (doubly spotted), represent the whole library for colony screening and can be requested from the Clemson University BAC/EST Resource Center (www.genome.clemson.edu)."

Agrobacterium tunefaciens.

Agrobacterium tunefaciens.

Bacteria; Proteobacteria; alpha subdivision; Rhizobiaceae group;
Rhizoblaum.

El (bases 1 to 811)

S Dhaese, P., De Greve, H., Gielen, J., Seurinck, J., Van Montagu, M.M.

Identification of sequences involved in the polyadenylation of higher plant nuclear transcripts using Agrobacterium T-DNA genes as models.

IL EMBO J. 2, 419-426 (1983)

The specification describes a pair of transgenic winter oilseed rape plants suited for producing hybrid seed. One of the plants has an expression cassette comprising a male-sterility gene (e.g. barnase gene), and the other plant has an expression cassette comprising a fertility restorer gene (e.g. barstar gene), integrated into the genome. The fartility gene. The plant pair is useful for producing hybrid seed and esterility gene. The plant pair is useful for producing hybrid seed genetic stability and adaptability to different genetic backgrounds. The present PCR primer was used to amplify the right flanking region of a vector in a transgenic plant which carries the TA29-barstar
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PCR primer MDB193 to generate the flanking region of elite event MS-B2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to a transgenic Brassica plant or its seed, cells or tissues, characterised by harbouring a specific transformation event, particularly by the presence of a male-sterility gene, at a specific location in the Brassica genome. Transgenic transgenic plant is useful for producing a hybrid seed by crossing the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant and harvesting the hybrid seed from the transgenic Brassica plant.

The present sequence is secondary thermal interlaced (TAII)-PCR primer The Brassica at the present sequence is secondary thermal interlaced (TAII)-PCR primer This primer corresponds to position 226-247 of plasmid procilis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Transgenic Brassica plants, seeds, cells or tissues, characterized by harboring specific transformation events, particularly by presence of male-sterility gene, at specific location in its genome -

The unique BglII-Ort (815-820) site ligating foreign DNA and the HindIII-Ort in the 3' polylinker (1080-1085) for cloning the cassette in the Ti-vector pGA471. The cassette is cloned into the binary Ti-vectors pGA471 and Agrobacterium tumefaciens is transfected. See also AAQ04703-Q04706.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Two transformed corn plants were analysed by means of Southern hybridisation. As a probe, a 1184 bp EcoRI-HindIII fragment derived from another plasmid was used. The sequence of that plasmid is given below. Results showed that at least a chimeric neo gene was integrated into the plant genomic DNA.
                                                                                                                                                                                                     Nicotiana tabacum; neomycine phosphotransferase; Agrobacterium; ss.

region containing polyadenylation signal of gene 7 og Agrobacterium T-DNA
                                                                                                                                                                                                                                                                                                 /function= 35S promoter of cauliflower mosaic virus strain CM1841
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The HindIII-ECORI fragment (AAT39337) of plasmid pTSB8 contains barstar DNA under control of a 35S promoter. The plasmid was used with pTS174 (see also AAT39336) contg. barnase DNA under control of the stamen specific promoter El to produce male sterile rice cv. Kochihibiki transgenic plants, and with plasmid pVEL16 (see also AAT39338) contg. barnase DNA under control of the stamenspecific PG55 promoter to produce male sterile malze plants. Expression of barnase (a ribonuclease) in the stamen leads to male sterility. Constitutive expression of barnase DNA in non-stamen tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Prodn. of male sterile plants by transforming with a chimaeric construct - comprising a male sterility DNA e.g. barnase and a co-regulating gene, e.g. barstar, into the nuclear genome, useful for generating hybrid cultivars
                                                                                                                            Plasmid pTS88; male sterile; barstar; barnase; ribonuclease;

It contains an generation of GFP:NFTI fusion protein constructs. It contains an gene, the coding sequence of EGFP:NFTI translational fusion, excised from DV126 and the Tr7 terminator. This plasmid is used to carry a chimeric gene, comprising an aleurone-specific promoter like L3, that is operably linked to the gene encoding a screenable marker, like Green fluorescent protein (GFP), luciferase or maize R gene. The gene fusions allow both selection and screening of transformants. The aleurone-specific promoters direct the expression of the marker genes in embryogenic tissues, allowing selection and screening of viable transgenic seeds. Screening of transgenic seeds avoids the need for growing and assaying of seeds for transgenes and allows implementation of automated seed screening techniques for the identification of

The present DNA sequence is the plasmid DV130, that is used in the generation of GFP:NPTII fusion protein constructs. It contains an expression cassette comprising, a promoter from the maize L3 oleosin gene, the coding sequence of MGFP:NPTII translational fusion, excised from DV127 and the T7 terminator. This plasmid is used to carry a chimeric gene, comprising an aleurone-specific promoter like L3, that is coperably linked to a gene encoding a screenable marker, like Green fluorescent protein (GFP), luciferase or maize R gene. The gene fusions allow both selection and screening of transformants. The aleurone-specific promoters direct the expression of the marker genes in embryogenic tissues, allowing selection and screening of viable transgenic seeds. Screening of transgenes and allows implementation of automated seed screening techniques for the identification of
                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  GFP:NPTII fusion protein construct, Lastacti intron/EGFP:NPTII/Trz, expression cassette; maize L3 oleosin gene; chimeric gene; transgene; EGFP:NPTII translational fusion; Tr7 terminator; luciferase gene; Green fluorescent protein; GFP; gene fusion; maize R gene; selection; screenable marker; screening; automated seed screening technique; assay; transformant; expression; embryogenic tissue; implementation; ds.
Screenable marker genes useful for identification of transgenic seeds
                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
